

B&B Tree Guide

Balled & Burlapped Trees

Why Choose Lanoha For Your Trees?

All of our stock is locally grown on our tree farms which means they have been acimated to our area since they were planted. They are dug with healthy oversized root balls to help reduce transplant shock.

Planting Guide

Before you plant your B&B tree, apply Myke Tree & Shrub Transplanter to the bottom of the hole and sprinkled over the root ball. A tree's root ball treated with Myke's absorbs 100 times more nutrients than one without Myke's.

Immediately following planting, apply Superthrive to the root system. Superthrive is not a fertilizer but a concentrated vitamin based hormone that stimulates root development. For trees, we recommend ½ cup of Superthrive per 5 gallons of water. Two or three applications of Superthrive during the first two months after planting are beneficial.

Watering Guide

Most plant material, including lawns, will survive on one inch of water per week. A method to determine if the tree needs water is to probe the soil with a long rod or long handled screwdriver to a depth of at least 12-18." If wet soil adheres and a ball of soil does not crumble between your fingers, do not water! If no soil adheres or the rod cannot penetrate the soil, use a slow trickle from a garden hose placed next to the tree trunk for 20-30 minutes. This ensures a good deep watering. You may not need to water for 10-14 days.

Helpful Hints & Maintenance

1. If the tree is installed during hot, dry, or windy conditions, a daily misting of water on the foliage will reduce stress. This should be done before the heat of the day, otherwise foliage may become scorched.
2. A 2-4" layer of wood chip mulch is recommended over the root ball area. Keep mulch 4" away from trunk. (Rock as a cover is discouraged)
3. We discourage the planting of blubs or annuals at or around the base of the tree. These plants require frequent watering which would be too much for the tree.
4. Keep sod away from the trunk area. This prevents damage from lawn mowers or weed trimmers.
5. Remove stakes at the end of the first growing season, if staked.
6. Use tree wrap during the dormant season or cold weather. This helps reduce frost cracks, and sunscald on many varieties. Remove tree wrap every spring to prevent girdling.
7. For deer or rabbit protection: use a section of corrugated drain tile around the tree trunk. The drain tile needs to be loose enough to allow for growth and air circulation.

PLEASE NOTE:

Many newly planted trees that die are often killed from too much watering.
